Basic Types			
integer	4 bytes		
long	8 bytes		
double	8 bytes		
boolean	1 buto		
Doolean	1 byte		
byte array	2 bytes for length (n), then n bytes		
string	2 bytes for string length then utf-8 encoded string.		
Lists	Lists are used in various places. List <t> indicates a list of elements of type T. Lists consists of the length of the list (n) using a VarUnsignedInt followed by n elements of type T</t>		
VarUnsignedInt	An encoding of an integer using 1 - 5 bytes If the first byte is 0 then the list is length 0 (1 byte in total) If the first byte is > 0 and < 128 then the list length is the value of the first byte (1 byte in total) If the first byte is -2 then the following 2 bytes represent the length of the list (3 bytes in total) If the first byte is -4 then the following 4 bytes represent the length of the list (5 bytes in total)		
Sequences	A sequence is an open ended list that may be grown. Sequence <t> indicates a sequence of elements of ty Each element in the sequence is preceded with a element follows marker. This allows elements to be apper the end of a stream (File).</t>		
AxiomList	Axiom Set Chunk Id	4 bytes	value = 'AXMS'
	Metadata Chunk	Lint Assignmen	
	Axioms	List <axiom></axiom>	
Ontologyld	Ontology IRI	string	May be empty
Ontologyid	Ontology version IRI	string	May be empty
	Anonymous Id	Sumg	Widy DO OTTIPLY
	If a character a is in the many \ 000d through \ 007f it is many and all houses he to		
utf-8 encoding of strings	If a character c is in the range \u0001 through \u007f, it is represented by one byte: (byte)c		
	If a character c is \u0000 or is in the range \u0080 through \u07ff, then it is represented by two bytes, to be written in the order shown: $ (byte)(0xc0 \mid (0x1f \& (c >> 6))) \\ (byte)(0x80 \mid (0x3f \& c)) $		
	If a character c is in the range \u0800 through uffff, then it is represented by three bytes, to be written in the order shown: $ (byte)(0xe0 \mid (0x0f \& (c >> 12))) \\ (byte)(0x80 \mid (0x3f \& (c >> 6))) \\ (byte)(0x80 \mid (0x3f \& c)) $
